Anglabe 1:
$$f = 2 \text{ liHe}$$
, $Angle : 2$

a) $S(t) = 2 \cdot \cos(2\pi gt) = \frac{2 \cdot \cos(2\pi \cdot 2000\frac{1}{5} \cdot t)}{2 \cdot \cos(2\pi \cdot 2000\frac{1}{5} \cdot t)}$

b) Psiodendauer $T = \frac{1}{3} = \frac{1}{2000} S = 0.5 \text{ms} = 500 \mu s$

2

Augabe 2:
$$f = 500 \text{ He} \implies T = \frac{1}{3} = 2 \text{ ms}$$

$$\Delta T = 0.3 \text{ ms} \implies \Delta T = \frac{9}{360^{\circ}} \implies 9^{\circ} = \frac{\Delta T}{T}.360^{\circ}$$

$$9_{\circ} = 54^{\circ}$$

Voreiland heißt "zeitlich frühe" \Rightarrow Linksveschiebung
$$S(t) = \cos(2\pi gt + 54^{\circ}) \quad \text{bit} = 0 \text{ ist dia Kosinus} - \frac{1}{5} \text{ modion buits bin } 54^{\circ}$$

alknativ hann die Phasanveschiebung auch im Bogamaß angegeben werden $\Rightarrow q = \frac{9}{2} = \frac{2}{2} = \frac{2}{10} = \frac{2$

Augabe 3: Die Mesinusfurtion hat den Wat 1, we das Funktionsorgunant die Wale $0, \pm 2\pi, \pm 4\pi, \pm 6\pi, \dots$ had. a) $2 \cdot \cos(\pi ct) = 2$ bu $t = 0, \pm 2, \pm 4, \pm 6, \dots$ a b) $\cos(4\pi ct) = 1$ bu $t = 0, \pm 0.5, \pm 1, \pm 1.5, \dots$

Aufgabe 6:

a)
$$s(t) = 2 \cdot \left[\Lambda (t-1) + \Lambda (t-2) + \Lambda (t-3) \right]$$

b)
$$s(t) = \left[4 \cdot \Lambda\left(\frac{t}{6}\right) - 2\right] \cdot \text{rect}\left(\frac{t-3}{6}\right)$$
